PETITION TO THE EUROPEAN UNION PARLIAMENT

PLACEMENT OF RETURN FEE DEPOSITS ON
ALL REMOVEABLE AND NONREMOVABLE BATTERIES
SOLD IN THE EUROPEAN UNION

22 I ask that the European union parliament to set laws for all standard and rechargeable
23 batteries and power banks preventing all standards and rechargeable batteries from early
24 and inadequate disposal that causes irreversible impact to the climate and natural resource
25 required to produce batteries. I ask that all deposits are added to all batteries and power
26 banks brands at the place of sale and redeemable by the places of sale for the brands of
27 batteries and power banks that are being sold in such places.

28

29 The type of batteries sold that should include deposit for the return of the battery
30 researchable resources are all standard consumer electronics batteries and power banks, and
31 also any batteries and power banks that are a part of all available to the public tools,
32 equipment and machinery, that includes all personal road, air and sea transportation vehicles
33 such as electric bicycles, electric mopeds, atv's, cars, suv's, vans, trucks; personal drones,
34 agricultural drones, helicopters, sea drones, submarine drones, wake boards, pontoon boats,
35 fishing boats and all the rest of the road, air and sea vehicles.

36

37 **The deposit calculation** should be based on the:

- 38 1. Sale price of battery minerals
39 2. Weight of battery mineral contained in one battery
40 3. Wrong disposal cost to the climate and environment
41 4. Co2 mining impact to global climate and environment
42 5. Weight amount of battery minerals in the circulation
43 6. Weight amount of battery minerals ore left on earth.
44 7. Other important factors determined.

45

46 **EU Battery Portal** should be prepared by the European Union for all battery information
47 that will provide details on how to safely return batteries in all EU member states and will
48 give EU member specific information's on how to return all batteries that were sold

49 without a battery deposit fee and with battery deposit fee. EU Battery Portal will allow the
50 consumers an easy way to return all brands and types of batteries and all products that
51 have batteries nonremovable to the consumer that need to be returned to the original
52 companies-brands that produce the products-batteries and information on brand existing
53 chain of the battery recycling industry such as retail points of sale, urban recycle facilities,
54 brand service recycle facilities, authorized service recycle facilities.

55

56 **All batteries** and the products with nonremovable batteries should have clear marks of
57 deposit on the battery and a website address to the EU Battery Portal. Portal should
58 contain general EU battery information and EU member specific battery information
59 relating to brand, return instructions that includes website addresses, emails and telephone
60 numbers to the individual brands with mail-in, drop-off refund information on all battery
61 brands sold and all companies that are accredited to accept batteries of specific brands that
62 are of specific types.

63

64 **All companies** that produce batteries and products containing non removeable batteries
65 should be obligated to accept the same batteries in all places that sale them unless sold
66 over the internet in which case the companies should allow free mail-in return for credit or
67 have own or contracted service point that accepts back the batteries and products
68 containing batteries directly from the consumers that purchased the product. Return of
69 batteries for refund of deposit with visibly marked battery brand and type should not
70 require proof of purchase Batteries with deposit marks that have been removed should still
71 be accepted under same rules and refund amount as the batteries that were produced
72 before the enactment of the Battery Deposit Law that I petition for.

73

74 **European Union** positive support of the petition is appreciated as the batteries need more
75 regulation that cover their safety, composition, correct handling, correct places and

76 procedures of return that refund deposits as the minerals contained in the batteries are
77 extremely expensive and hazardous to the human health and environmental safety that
78 impacts world climate and battery resource availability.
